Introduction to Modern Confocal Microscopy and its Applications (Lecture in English)

Claudia Florindo・渡邉 俊之（アンドール・テクノロジー）
朝比奈 欣治・山元 武文（実験実習支援センター）
Claudia Florindo, Toshiyuki Watanabe (Andor Technology, Oxford Instruments)
Kinji Asahina, Takefumi Yamamoto (Central Research Laboratory)

One of the drivers of novel research breakthroughs in modern Life Sciences is the use of microscopy. Therefore, it is not surprising that researchers use a wide range of microscopy techniques to understand fundamental concepts in Life Sciences and biomedical research. In fact, novel technologies and experimental methodologies are essential to push the boundaries of research.

In this talk, I will explain the principles of fluorescence microscopy and the differences between widefield and confocal microscopy. In addition, an overview of the differences between multipoint confocal imaging systems (also known as spinning disks) and point scanner confocal imaging systems (also known as laser scanning confocal microscopes) will also be given. Finally, I will introduce Dragonfly, Andor's High-end multipoint confocal. Dragonfly.

Dragonfly Multimodal Confocal was designed to integrate biological imaging from single cells to a tissue or organism context. Key to this is exceptionally high background rejection in thick samples, a very low noise floor to retain detection of low signal fluorescence as well as high-intensity labelling, and live volume rendering for instant sample exploration.

Researchers using the Dragonfly confocal platform publish outstanding science in high-profile journals. In this webinar, I will show examples of published data acquired with the Dragonfly multimodal system. In addition, I will present data from different research areas in biomedical science and show different applications/techniques of up-to-date microscopy.

現代のライフサイエンスにおいて、顕微鏡は新しい研究のブレークスルーをもたらす原動力のひとつとなっています。研究者が生命科学や生物医学研究の基本的な概念を理解するために、さまざまな顕微鏡技術を使用しており、研究の限界を押し広げるためには、新規の技術や実験方法論が不可欠です。

本講義では、蛍光顕微鏡の原理と蛍光顕微鏡と共焦点顕微鏡の違いについて説明します。さらに、マルチポイント共焦点イメージングシステム（スピニングディスク共焦点）とポイントスキャン共焦点イメージングシステム（レーザー走査型共焦点）の違いについても説明します。最後に、Andor のハイエンドマルチポイント共焦点である Dragonfly を紹介します。

Dragonfly マルチモーダル共焦点は、単一細胞から組織や個体の状況まで、生物学的なイメージングのために設計されました。その鍵となるのは、厚いサンプルにおける非常に高いバックグラウンド除去、高輝度シグナルと同様に低シグナル蛍光を検出するための非常に低いノイズ、サンプルを瞬時に探索するためのライブボリュームレンダリングです。

Dragonfly の共焦点プラットフォームを使用する研究者は著名なジャーナルに優れた科学を発表しています。本講義では、Dragonfly マルチモーダルシステムで取得された公開データの例を紹介します。また、バイオメディカルサイエンスの様々な研究分野のデータを紹介し、最新の顕微鏡の様々なアプリケーション技術を紹介する予定です。

3. Caveats in Fluorescence microscopy
Autofluorescence

OXFORD INSTRUMENTS ANDOR

The causes of auto-fluorescence:

Autofluorescence of endogenous molecules

Less than ideal filter set

reactivity of to the fixative used

Reflections and scattering of light in the optical pathway

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
bleed trough effect

OXFORD INSTRUMENTS ANDOR

Extremely relevant when imaging: multiple fluorochromes or fluorescent proteins simultaneously.

Causes of Bleed-though:

- non ideal filter set that in which the band pass wavelengths are quite close.
- non ideal fluorochrome choice for the experiment / microscope set up.

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
bleed trough effect

OXFORD INSTRUMENTS ANDOR

Possible solutions:

Reduced exposure times minimize the effect

Use high specific filter set with narrow bandpass.

Nevertheless there might always be some signal cross-over.

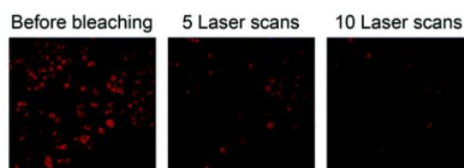
© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
Dye Photobleaching

OXFORD INSTRUMENTS ANDOR

Photobleaching or fading is the chemical alteration of a dye or a in a way that will be irreversibly damaged.

When a dye suffers photobleaching it will not Fluoresce anymore.



Orit Redy-Keisar, et al., 2015.

Today´s Webinar

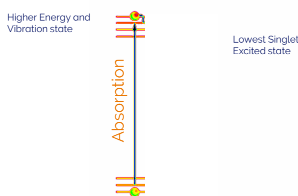
OXFORD INSTRUMENTS ANDOR

- How does Fluorescence works
- What is the hardware required
- Caveats in Fluorescence microscopy
- Set up and Design

© Oxford Instruments 2020

1. How does Fluorescence works
Physics of Fluorescence

OXFORD INSTRUMENTS ANDOR

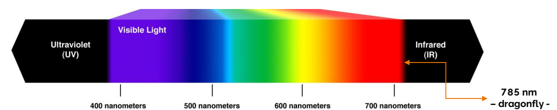


- Fluorescence is the emission of photons by atoms or molecules whose electrons are transiently stimulated to a higher excitation state by radiant energy from an outside source.
- Fluorescence ceases in the moment that incident excitation light terminates.

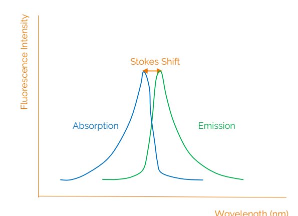
© Oxford Instruments 2020

1. How does Fluorescence works
Fluorochromes

OXFORD INSTRUMENTS ANDOR



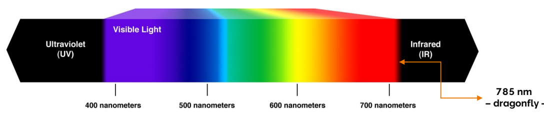
- Molecules that fluoresce are called fluorochromes.
- Fluorochromes have maximum absorption and emission peaks
- Stokes shift is the difference between the absorption an emission peaks



© Oxford Instruments 2020

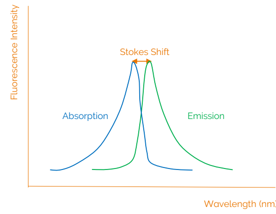
1. How does Fluorescence works
Fluorochromes

ANDOR



- The Features of the fluorochromes are dependent on the chemical environment:
pH, redox potential, ionic strength….

- Three desirable features of any fluorochrome:
1) High quantum efficiency,
2) Resistance to quenching
3) Resistance to photobleaching



© Oxford Instruments 2020

1. How does Fluorescence works
Fluorochromes

Chemical dyes

- **Alexa dyes**
- **Hylite dyes**
- **cyanine dyes**

1. How does Fluorescence works
Fluorescent Proteins

ANDOR

Fluorescent proteins

Photo-convertible – fluorescent proteins

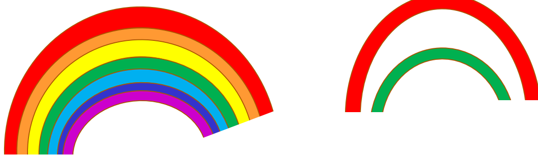

Photo-switchable – fluorescent proteins

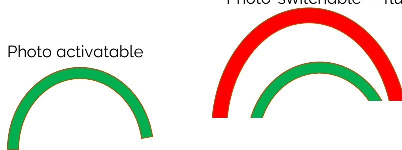
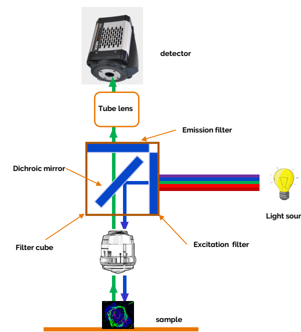
Photo activatable



© Oxford Instruments 2020

2. hardware

The epi-fluorescence microscope

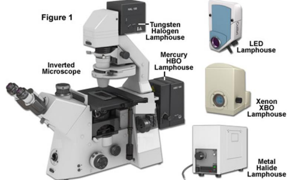


- **Light source**
- **Fluorescent filter set/cube**
- **Objective lenses**
- **Digital acquisition cameras**

© Oxford Instruments 2020

2. Hardware
Light source for fluorescent microscopy

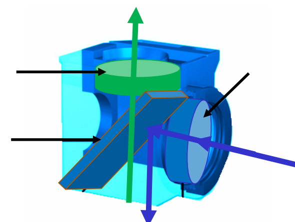
ANDOR



- 10-100x brighter than halogen lamps
- Mercury arc lamp
- Xenon arc lamp
- Metal Halide
- LED
- Integrated Laser Engine (ILE)
  - for Widefield laser illumination

© Oxford Instruments 2020

2. Hardware
Fluorescent filter set

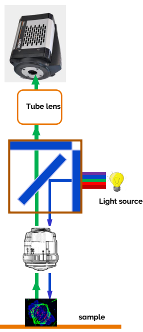


- Fluorescent filter set are arranged in a filter cube
- 3 main components: excitation filter, dichroic mirror, emission filter

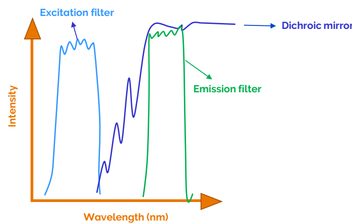
© Oxford Instruments 2020

2. Hardware
Fluorescent filter set

OXFORD INSTRUMENTS ANDOR



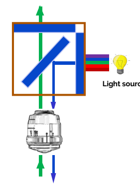
- **Fluorescent filter set enable illumination of the sample with specific excitation wavelength while registering only specific emission light to the observer**

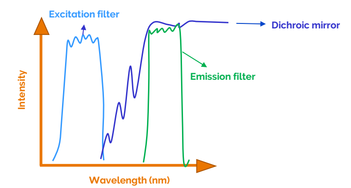


© Oxford Instruments 2020

2. Hardware
Fluorescent filter set

OXFORD INSTRUMENTS ANDOR





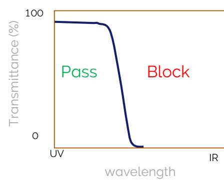
- excitation filter specifically allows the passage of excitatory wavelength light
- Dichroic mirror directs excitation light to the sample and enables specific passage of emission light to the emission filter
- Emission filter further stringe the passage of specific emitted wavelength from the specimen

© Oxford Instruments 2020

2. Hardware
Fluorescent filter set

OXFORD INSTRUMENTS ANDOR

- different types of filters named after their capacity to discriminate between different wavelengths
- excitation filter are in general short pass

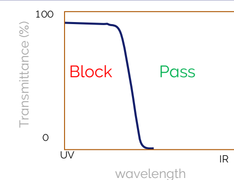


© Oxford Instruments 2020

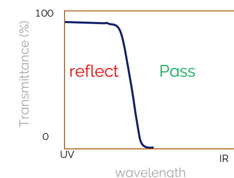
2. Hardware
Fluorescent filter set

OXFORD INSTRUMENTS ANDOR

- emission filters are in general long pass



- Dichroic splitters reflect some wavelengths and allow others to pass.

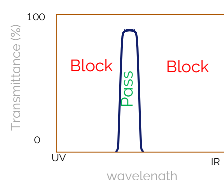


© Oxford Instruments 2020

2. Hardware
Fluorescent filter set

OXFORD INSTRUMENTS ANDOR

- Narrow band pass filters
  - Only allow a stringent set of wavelengths to pass through



© Oxford Instruments 2020

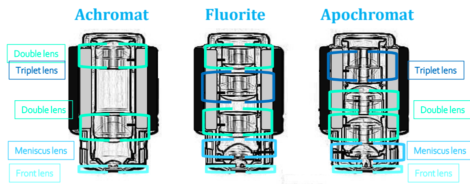
2. Hardware
Fluorescent filter set

OXFORD INSTRUMENTS ANDOR

- **By using the characteristics of different filters and dichroic mirrors we can create specific filter set adequate to the type of fluorescent imaging experiments**
- **Two basic types of filter cube sets: 1) single and 2) multiple filter sets**
- **Single fluorescent filter set enable high signal to noise ratio but slower imaging**
- **multiple fluorescent filter set enable faster imaging but lower signal to noise ratio**

© Oxford Instruments 2020

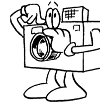
2. Hardware
Objectives



- Higher NA → Higher resolution
- transparent to UV light (Use UV dyes)
- made out low-fluorescent glass
- plan-fluorite and plan apochromatic objective lenses are ideal
- Lenses have to correct for chromatic plane shift and act as a condenser

© Oxford Instruments 2020

2. Hardware
Cameras



How about cameras?
Are they colour cameras or Black and white?

In Fluorescence Microscopy most common cameras are Black and White

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
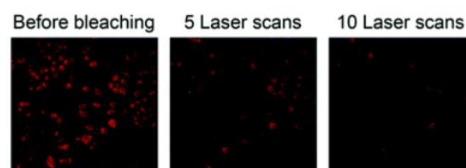
Dye Photobleaching

OXFORD INSTRUMENTS ANDOR

Photobleaching or fading is the chemical alteration of a dye or a in a way that will be irreversibly damaged.

When a dye suffers photobleaching it will not Fluoresce anymore.

Before bleaching | 5 Laser scans | 10 Laser scans



Orit Redy-Keisar, et al., 2015.
Organic & Biomolecular Chemistry

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
Dye Photobleaching

ANDOR

Caused by increased exposure of fluorochromes to light

Intensified energy exposure leads to formation of radicals, which will cause modifications in the covalent bounds of the fluorochrome.

The result is transition from singlet state to the triplet state.

Photobleaching is irreversible

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
Dye Photobleaching

ANDOR

Avoiding photobleaching:

Use the most photostable dye possible.

Reduce the O2 in the sample
- use N2
- Use oxygen scavengers

use of anti-fading reagents in the embedding media

Reduce exposure time

© Oxford Instruments 2020

3. Dye Photobleaching Applications
FRAP

ANDOR

Applications of photobleaching in microscopy:

FRAP - Fluorescence Recovery After Photobleaching

Diffusion of molecules

Vesicles transport

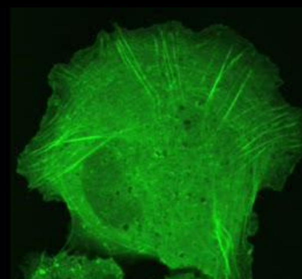
Transport along the microtubules

© Oxford Instruments 2020

3. Dye Photobleaching Applications
FRAP

ANDOR

Protein diffusion and compartmentalisation



FRAP done using ANDOR Mosaic (photo stimulation applications)

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
Live cell phototoxicity

ANDOR

The Light sources used in are highly energetic and can also transmit UV light.

Filters and dichroic mirrors are not totally efficient in blocking those wavelengths

This causes:
Damage in cell wall lipids and proteins leading to rapid cell death

© Oxford Instruments 2020

3. Caveats in Fluorescence microscopy
Live cell phototoxicity

ANDOR

Solutions:

Reduce effect with additional UV filters, exposure times and balanced redox environment (when using metal halide light sources)

Use laser widefield illumination. This will selectively illuminate the sample only with the chosen laser lines

Use longer wavelengths for imaging in live cells

If possible use NIR wavelengths (avoid UV)

Choose an imaging system compatible with live imaging experiments, such as a dual micro lens spinning disk system.

© Oxford Instruments 2020

3. Set up and design

OXFORD INSTRUMENTS ANDOR

What are the microscopes available?

What filter sets do those microscopes have?

What are the lasers available?

What do I want to do?

© Oxford Instruments 2020

3. Set up and design

OXFORD INSTRUMENTS ANDOR

What do I want to do?

Live or fixed sample

Multicolour or single colour experiment?

Fluorescent antibodies
Fluorescent proteins
Quantum dots

Select the appropriate fluorochromes or fluorescent proteins

Design the sample preparation protocol

Before going to the microscope – design the image acquisition protocol

3D Image Reconstruction

A confocal data set is similar to a book. A book has many pages, and each page shows information only available if you move down to that page and ready it. Reading a page in a book, is just like scanning with a confocal microscope – you remove all of the other pages!

© Oxford Instruments 2020

Confocal Point Scanner Summary

OXFORD INSTRUMENTS ANDOR

The laser beam excites a point on the specimen.
It also inadvertently excites other points on the specimen.

Only the in-focus emission light is allowed to be detected by the PMT.

The light detected by the PMT is associated to a pixel (picture element) on the monitor.

The laser beam then moves to the next point and another pixel is collected.

Challenges in spinning disk confocals

OXFORD INSTRUMENTS ANDOR

- Practical limit of SNR is often set by the non-specific background of the specimen.
- This is the biggest challenge for multi-beam owing to the lack of a single discrete pinhole.
- Traditionally multi-beam starts to suffer with samples over 30um thickness

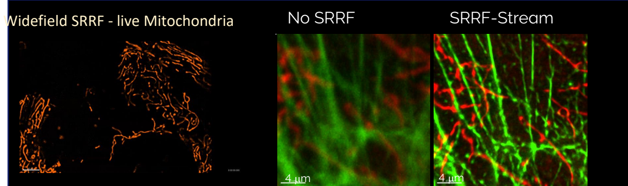
What is SRRF?
Super Resolution Radial Fluctuations

A B C D

- Spatial Intensity fluctuations in a fluorophore are temporally captured
  - Typically, short exposures for fast sampling
- Intensity gradient from a single fluorophore is spread over a number of pixels (B).
  - The radiality symmetry is indicative of the locale of fluorescence emitters
- A super-sampled grid (C) is used to provide a weighted super-resolution estimate of the point of origin (D)
- In SRRF the number of images per sequence can be varied to trade spatial and temporal resolution

© Oxford Instruments 2020

SRRF-Stream



SRRF-stream yields an increase of resolution between 2- and 6-fold (50-150 nm final resolution) in the final data.

Low power requirements (mW/cm2 to W/cm2 range) make SRRF-stream compatible with live-cell imaging.

SRRF-stream algorithm allows acquisition super resolved images deep inside cells and tissues.
